

JSON-LD – Key Features

- Add `@context` to JSON to associate terms (properties) with IRIs which define them.
 - Describe the expected types for string values of properties
 - IRI, Dates, Numbers, ...
 - Treat collections as lists or sets.
- Encourage the use of well-known identifiers for entities, and provide typing (`@id` and `@type`).
- (much more, see [JSON-LD 1.0](#) for a complete feature set).

JSON-LD 1.1

- It's been over three years since JSON-LD 1.0 was published, and feature requests have been mounting:
 - 36 issues addressed since 1.0 (15 still open)
 - Use objects to index into collections, rather than only array form
 - Previously restricted to `@index` and `@language`. Now available on `@id` and `@type`.
 - Can include `@set` with other container types (e.g.: `"@container": ["@set", "@language"]`).
 - Framing, never complete in 1.0. Now provides ability to match on `@id`, inclusive or exclusive `@type`, property values, and specifics of a value object. Supports framing of datasets, not just graphs.
 - Contexts scoped to terms: property values or entities using a given type term can overlay terms-specific contexts.
 - Ignore some elements of JSON structure.
 - Abstract from JSON-itself, allowing for YAML, CBOR and other LD representations.
